

Dear patients,
des ladies and gentlemen,

back from "Laser Helsinki 2008" the 13th International Congress of EMLA (European Medical Laser Association – www.laserhelsinki.fi and www.emla-laser.eu), I can report you, that the knowledge about the fundamental biological mechanism of the positive effects of natural light and low level laser light and the clinical fields of application of low level lasertherapy are growing constantly.

In the focus are still the mitochondria and their nature to transform therapeutical laser light into the cellular energy ATP (Adenosin Tri Phosphat, www.dr-wilden.de).

This biological ability of our cellular power stations, which are located in every of our 5 billion body cells, explains the large and harmonic effectiveness of laser therapy.

Between the international therapists was a clear agreement to the fact, that for reaching the best and most stabil therapy results it is recommendable to receive laserlight in a sufficient amount and as long as necessary.

This confirms again the therapy quality of the highdosage low level laser therapy by Dr. Wilden® and/or the MLS (Medical Laser System, www.energytransmitter.com, www.lumomed.de).

As a special news I want to report you the study of the University of Heidelberg (Germany) "Low Level Laser Therapy improves vision in patients with age-related Macula Degeneration" from B.T. Ivandic M.D. and T. Ivandic M.D..

The study examined the effect of laser therapy on 203 patients and shows, that Low Level Laser Therapy (LLLT) significantly improved visual acuity (visial capacity) in 97% of the patients (the paper can be request from us).

Because the seeing cells are "sister cells" to the hearing cells this result is also again a confirmation of the highdosage low level laser therapy by Dr. Wilden® and/or the MLS.

I wish you a good time and please don't hesitate to ask us, if there are questions for you and please do also not hesitate to give us your personal report regarding your individual experiences you have with the highdosage low level laser therapy by Dr. Wilden® and/or the MLS.

Important for all inner ear patients is to avoid the loudness.

Sincerely

Dr. med. Lutz Wilden
